

## Tools Module

The Tools Module provides a helpful set of tools for site users to use to their advantage. This solution offers a number of Tutorials which is an online repository of help documents and videos covering the different features within the application. With the ability to add to this list at the System Administrator level, this is a very powerful tool for creating a customized "knowledge Bank" of how to use the various solutions in the application. Administrators will also have access to a Tutorials View Log to see who in the Organization is taking advantage of this solution, and a Login History log which provides a great way to monitor and scope the site users. The entire application lays on a platform of automated email notifications, and through the Tools Module, you can track every email alert that has been sent through the Alerts Sent Module Item. End-Users will also have the ability to change their system password through this module in the Change Password Module Item.
